achieved by blocking free radical production or the accumulation of free radicals in that cell. Treatment of insulin dependent diabetes can elitius (IDDM) can be achieved by by blocking nitric oxide (NO) production in a pancreatic beta cell and by providing a composition comprising an agent that reduces levels of fatty acids in the cells of and protects beta-cells of the subject against lipid-mediated cell death. Cells can also be protected against lipid-mediated cell catty cicity by introducing into the cell an antioxidising agent. The methods can be used for protecting cells against immunotoxicity candiated by, e. g. Ll-1 beta, IL-1 alpha, gamma IFN, Thr alpha, Thr beta, IL-8, IL-7, IL-7, IL-7, IL-7, IL-17, C. chemoattractant protein-1. The methods can be used for the treatment of e.g. insulin-dependent diabetes mellitus (IDDM), NIDDM, obesity, wasting syndromes, short stature, osteoporosis, inflammatory diseases, autoimmune diseases, or neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protection of mammalian cells against immunotoxicity or lipotoxicity - used for treating, e.g. diabetes, obesity, wasting syndromes, osteoporosis, inflammatory diseases, autoimmune diseases or neurodegenerative diseases.
                                                                                                                                          Manganese containing superoxide dismutase; MnSOD; IDDM; diabbetes mellitus; treatment; therapy; nitric oxide; NO; beta cell; fatty acid; lipotoxic; cytotoxic; cytokine; osteoporosis; inflammatory disease; autoimmune disease; neurodegenerative disease.

Expression of inflammatory cytokines and inducible nitric oxide
synthase in brains of SIV-infected rhesus monkeys: applications to
synthase in brains of SIV-infected rhesus monkeys: applications to
HV-induced central nervous system disease.";
MOI. Med. 2:27-37(1996).

I.E. PUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE
WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. INOS AND NO MAY
CONTRIBUTE TO SIMIAN IMMUNODEFICIENCY VIRUS (SIV)-INDUCED CENTRAL
CONTRIBUTE OSIMIAN IMMUNODEFICIENCY VIRUS (SIV)-INDUCED CENTRAL
CONTRIBUTE AND NADE(+).

I.C. CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE +
NITRIC OXIDE + N NADP(+).

I.C. COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES
TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF
THE ENZYME (BY SIMILARITY).

THE ENZYME (BY SIMILARITY).

LINING BEGILATION: NOT STIMULATED BY CALCIUM/CALMODULIN (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. -!- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. IN MACROPHAGES, NO MEDIATES TUMORICIDAL AND BACTERICIDAL ACTIONS. MAY BE INVOLVED IN THE PATHOGENESIS OF DILATED CARDIOMYOPATHY OR OF EXERCISE INTOLERANCE OBSERVED IN PATIENTS WITH CHRONIC HEART FAILURE.

-!- CATALITIC ACTIVITY: L-ARGININE + N NADPH + M O(2) - CITRULLINE + NITRIC OXIDE + N NADP(+).

-!- COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF

PROBABLY INVOLVED WITH RAS-RELATED PROTEIN RAB-3A IN SYNAPTIC VESICLE TRAFFELS AND/OR SYNAPTIC VESICLE TRAFFELS AND SYNAPTIC PROGRED. FUSIOLE FUSION. COULD PLAY A ROLE IN NEUROTRANSMITTER RELEASE BY REGULATING MEMBRANE FLOW IN THE NERVE TERMINAL.

C:Comment: This enzyme, located in peroxisomes, catalyzes the oxygen-specific oxidation; this reaction is the initial step of the peroxisomal beta-oxidation system. In C. tropgene family.
C:Comment: The peroxisomes are eukaryote subcellular organelles that generate and degrad ic reactions as well as the enzymes involved are usually different from the mitochondria G:Genetics:
A:Genetics:
A:Genetics:
A:Genetics:
C:Superfamily: acyl-CoA oxidase
C:Keywords: FAD; fatty acid oxidation; flavoprotein; oxidoreductase; peroxisome

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 3,

                                                                                                                                       specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autolimune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (intoS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inducible nitric oxide synthase; 1NOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                          This invention describes an immunoassay method where a sample with a
              Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psorlasis, and multiple sclerosis. This sequence represents a peptide fragment from human iNOS which is used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes an immunoassay method where a sample with a specific blinding entity (e.g. a monoclonal antibody) readtive to human inducible nitric oxide synthase (iNoS) or mimics of this protein is used to detect the presence of human iNoS protein in the sample. The method can be used for the detection and quantitation of human iNOS in calls and tissues for various pathophyslological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following such as lupus, psorlasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the

```
This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. AAQ66914 is from human hepatocyte inducible nitric oxide synthase CDNA clone pHINOS from lambda Zap II cDNA library. The original source was induced human hepatocyte RNA. HINOS cDNA plasmid is pref. transformed in E. coll SOLK (ATCC 69126). The inventors claim a clone with the cDNA sequence in AAQ66914 and a cDNA clone which encodes AARS5764. The cloning and expression of a human tissue nitric oxide synthase cDNA provides a source of the enzyme for therapeutic purposes, for example to prevent the hypotensive shock seen with
                                                                                                                                                                                                                                                                                                                                                                     cDNA clone encoding human inducible nitric oxide synthase to prevent the hypotensive shock seen with sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nitric-oxide-synthase; NO-synthase; NOS; chondrocyte; interleukin-1-beta; pESHSINOS; arthritis; hypertension; septic shock; inflammation; ischemia; dementia; obesity; agonist; antagonist; vector; CHO; Chinese hamster ovary;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibition of cytokine mediated immunotoxicity of cells can be achieved by blocking free radical production or the accumulation of the archived by blocking free radicals in that cell. Treatment of insulin dependent diabetes mellitus (IDDM) can be achieved by by blocking nitric oxide (NO) production in a pancreatic beta cell and by providing a composition or comprising an agent that reduces levels of fatty acids in the cells and protects beta-cells of the subject against libid-mediated cell cant, cells can also be protected against nitric oxide mediated cytotoxicity by introducing into the cell an antioxidising agent. The methods can be used for protecting cells against immunotoxicity mediated by, e. g. IL-1 beta, IL-1 lalpa, gamma IRN, TNF alpha, TNF beta, IL-8, IL-2, IL-6, IL-3, IL-5, IL-7, IL-9, IL-14, IL-17, IL-9, IL-14, IL-17, granulocyte-macrophage colony stimulating factor or monocyte chemoattractant protein-1. The methods can be used for the treatment of e.g. insulin-dependent diabetes mellitus (IDDM, NIDDM, obesity, wasting syndromes, short stature, osteoporosis, inflammatory. cities asses, autoimmune diseases, or neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                            0;
                                                   Human chondrocytes were incubated with interleukin-1-beta to induce nitric-oxide-synthase. cDNA was generated and used to construct a library in lambda ZAPII. This was screened with a 650 bp fragment of mouse inducible NO-synthase cDNA to identify the full-length clone pBSHSINOS. The insert was transferred to pSVL to give a vector capable of expressing NO-synthase in CHO cells under control of a heterologous constitutive promoter.
                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             An inducible nitric oxide syntase (iNOS = AAR88464) is the product of a CDNA clone (AAT10115) derived from human hepatocytes induced for iNOS biosynthesis. The iNOS can be obtd. by expression of the CDNA e.g. in mammalian host cells and is used in the development of selective inhibitors of NOS or to treat diseases
identifying enzyme inhibitors and stimulators, and for diagnosis and treatment of e.g. viral infections or tumours

Its amino acid sequence was deduced from a cDNA clone (see AAT98199) derived from human penile smooth muscle cell mRNA. The invention is directed to a method of treating erectile dysfunction in a patient by providing an agent capable of treating erectile dysfunction, and introducing an effective amount of the agent into the penile tissue of the patient. Preferably, the agent increase in the level of NOS in tissue. Preferably, the NOS is iNOS, and the agent is introduced into the corpora cavernosa of the penis. The agent is preferably an NOS inducer, an NOS protein such as HPINOS, a cDNA encoding an NOS such as HPINOS, or CDNA transformed penile cells, especially corpora cavernosa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treatment of erectile dysfunction - by introducing an agent into penile tissue, particularly for inducing cavernosal smooth muscle relaxation or increasing NOS levels
                                                                                                                                                                                                                                                                 Nitric oxide synthetase; NOS; iNOS; HPINOS; human; erectile dysfunction; impotence; gene therapy; corpora cavernosa;

                                                                                                                                                                         Use of a nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase, especially useful in gene therapy for enhancing and/or inducing angiogenesis and treating atherosclerosis \cdot
                                                                                                                                                                                                                                                                            The present invention relates to use of a nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase (NOS) activity for the manufacture of a composition for essentially isolated tissue perfusion treatment to enhance and/or induce anglogenesis. The nucleic acid delivery vehicle is particularly useful in gene therapy for the treatment of atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human INOS or mimics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes a method for gene therapy for enhancing and inducing angiogenesis. The method uses a nucleic acid delivery vehicle, which comprises a nucleic acid encoding nitric oxide synthase (NOS). The delivery vehicle is used for the manufacture of a pharmaceutical composition for isolated tissue perfusion treatment. The method is useful for enhancing and/or inducing angiogenesis in patients with endothelial dysfunctions, in particular arteriosclerosis. The present sequence represents an inducible NOS.
                                                                                                       Amino acid sequence of a human inducible nitric oxide synthase (NOS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or minics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psorlasis, and multiple sclerosis. This sequence
                                                     This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNoS) or mimics of this protein is used to detect the presence of human iNoS protein in the sample. The method can be used for the detection and quantitation of human iNoS in cells and tissues for various pathophysiological conditions such as sepsis, septic
                                                                                                                                                                         shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inducible; nitric oxide synthase; iNOS; human; immunoassäy; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis; epitope mapping.
